

A circular phylogenetic tree showing the relationships between various bacterial strains based on their 16S rDNA sequences. The tree is organized into several major clades, with branches radiating from the center. The outermost ring of the tree is labeled with the names of the bacterial strains. A legend in the top right corner indicates that the tree is based on 0 copies (represented by a grey circle) and 1 copy (represented by a black circle) of the 16S rDNA gene. The tree is set against a light grey background.
