

A circular phylogenetic tree showing the relationships between various bacterial strains based on their 16S rDNA sequences. The tree is organized into several major clades, with branches radiating from a central point. The outermost ring of the tree is labeled with the names of the bacterial strains, which are grouped into several distinct clusters. A legend in the top right corner indicates that the tree is based on 0 copies (represented by a grey circle) and 1 copy (represented by a white circle) of the 16S rDNA gene. The tree is set against a light grey background.
